The Brick Bud: Brickwork safety & innovation within British Construction.

The British Construction sector has shown a steady improvement and upwards progression in their innovations and safety over the past few decades... except in the realms of new-building housing development, and specifically how brickwork is shored-up after being built, where there has not been any significant strides into innovation at all really... until **Carl Harris**, founder of **Harris Brick Safety Systems** created the **Brick Bud**.

A groundbreaking and award-winning pre-fabricated brick/block-work shoring system, used to safely stabilise newly built walls, where otherwise historically pieces of wood, battens, etc and (more commonly) scaffold boards were used to essentially attempt to stabilise these potentially fragile freshly laid walls - and in doing so adds to the risk of these walls collapsing, which many inevitably do, causing obvious issues to safety, puts projects timescales back and ruins many of the materials used, ie the bricks/blocks and cement...

The **Brick Bud** helps negate ALL these issues and is not only the safer alternative - by FAR but it is considerably more environmentally friendly saving over 35 million bricks from being ruined annually and reducing MASSIVE amounts of CO2 being pumped into the atmosphere due to having to replace the now damaged brick/blocks and cement.

Not to mention that using scaffold boards in particular to shore up any newly built walls does **not** conform to Temporary Works guidelines, and it also creates a possible safety issue, as the scaffolders on these projects would then attempt to use and/or carry said scaffold boards, and find themselves impaled on the rusty nails/screws used to join the non-compliant and unsafe "scaffold board shorings" together.

This is where the **Carl Harris' Brick Bud** comes into its own.

The system bypasses the need for any Temporary Works designs or conformity having been tried and tested throughout the UK, and completely removes the risks of injury to the scaffolders on site.

The **Brick Bud**: safe, compliant, innovative, environmentally friendly, and ULTRA ACCESS is proud to endorse this fantastic product.
